Profile Spade Sampler with reinforced sides

Information

The Profile piercing spade is the ideal tool for assessment of turf-bearing layers. The sample is extracted with a special metal two-part extractor. After removal, the parts are unscrewed. The sample remains in one half of the spade and can very well visually be checked on soil and plant properties such as profile, composition, density, rooting quality and depth, etc.

After the examination, the sample can accurately be re-inserted into the lawn.

Technical Specifications

Technical data:

- Material stainless steel
- Weight – 2.6 kg
- Total length – 750 mm
- Insertion depth – 200 mm

Item-No.: 42060
